AUDIPY AND AMY

AI in AUDIPY.
Traceable, not a black box.

Not as much AI as possible, but the right method for each step. AMY chooses the right tool, AUDIPY calculates and records every step. The result: analyses you can substantiate.

Tools calculate. AI connects. People decide.

The difference

AI AS A CHAT PARTNER

The answer is there. The work goes on.

- **Generate:** the calculation as code
- **Run:** provide data and environment yourself
- **Check:** logic and result
- **Correct:** the next attempt, for every analysis from scratch

AI IN AUDIPY

AMY chooses the method. The tool carries it out.

- **Task:** audit question and suitable data
- **Selection:** AMY suggests procedures and parameters
- **Execution:** the existing analysis calculates the result
- **Audit trail:** data, tool and result remain traceable

Four forces, one audit trail

Rules, statistics, generative AI and people solve different parts of the same audit question.

RULES

Check exactly

Mandatory fields, totals, formats, fixed thresholds and repeatable workflows.

same result for the same input

STATISTICS

Find patterns

Distributions, deviations, relationships and prioritisation of large data sets.

anomaly, not verdict

GENERATIVE AI

Connect

Language, classification, selection, explanation and orchestrating the tools.

flexible, but needs control

PEOPLE

Assess

Goal, context, scepticism, edge cases, approvals and professional responsibility.

decide on the facts

How AMY works

The data volume is large, the AI task stays focused. AMY receives a description of your data, meaning field names and structures, not the data rows. She chooses methods and calls the existing analyses in AUDIPY. The calculation runs locally with the tools, and results remain visible and reusable.

What you can trace in every result

Level	Question	Your task
Data	Which data set, which period, which selection?	classify
Tool	Which analysis, link or formula was used?	check
Result	How is the key figure derived, and what does it mean?	assess

Every step in AUDIPY is recorded, including the steps taken by AMY. Results can be explained, reviewed and taken into the report. Before a calculation runs, the Code Gatekeeper checks the generated code for the right intent, correct logic and freedom from errors.

The possibilities

ASK MY DATA

Questions in plain language

AMY answers as a table, chart or text and spots anomalies without you writing a formula.

MAGIC PROMPT

Structured analysis

Three fields instead of free wording: system, industry and an expert hint. The result is a thematically structured analysis.

LOGIC²

Reasoning made visible

AMY first analyses structure and content, chooses columns and methods and makes the path to the answer visible.

COLUMNS AND SUGGESTIONS

From your description

New columns from a description, suitable analyses for your data set based on the field names.

AUDITPLUS WITH AMY

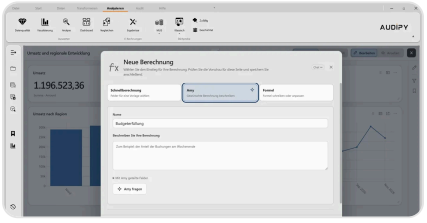

Models and dashboards

Tables become a data model, a question becomes a dashboard. Created by AMY, refined by you.

PLAYBOOKS

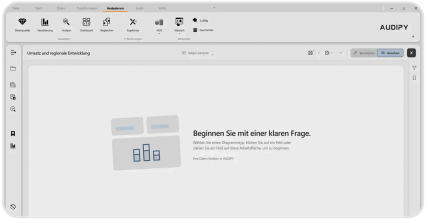

AI agents of your choice

Via the open MCP standard, agents operate AUDIPY step by step. Every step remains traceable.

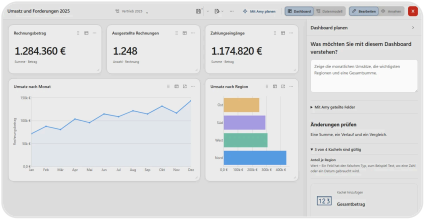

Calculation with AMY

Original AUDIPY interface with sample data.

Data model with AMY

Dashboard suggested by AMY

An example: 1,000 e-invoices

RULES

Check the entire data set

Format, mandatory fields and calculation rules, for all invoices, locally and repeatably.

AI

Clarifies selected questions

Only the conspicuous cases go to the AI: classify and explain. Conspicuous is not wrong: the machine prioritises, you decide.

Data protection: AUDIPY uses Mistral AI with Zero Data Retention. Further models can be connected, and GPT4All is available for operation without internet. AI results may contain errors and do not replace professional review.

On request, we show you AMY online in English, free of charge. Or simply get in touch with us directly.
